Introduction to ggplot2

R Pruim

CVC 2016

Goals

What I will try to do

- give a tour of ggplot2
- explain how to think about plots the ggplot2 way
- prepare/encourage you to learn more later

What I can't do in one session

- show every bell and whistle
- make you an expert at using ggplot2

Set up

```
require(mosaic)      # loads ggplot2 as well
theme_set(theme_minimal())
data(Births78)       # restore fresh version of Births78
head(Births78, 3)
```

```
##         date births dayofyear wday
## 1 1978-01-01   7701         1  Sun
## 2 1978-01-02   7527         2  Mon
## 3 1978-01-03   8825         3 Tues
```

The grammar of graphics

geom: the geometric "shape" used to display data (glyph)

▶ bar, point, line, ribbon, text, etc.

aesthetic: an attribute controlling how geom is displayed

▶ x position, y position, color, fill, shape, size, etc.
scale: conversion of raw data to visual display

▶ particular assignment of colors, shapes, sizes, etc.

guide: helps user convert visual data back into raw data (legends, axes)
stat: a transformation applied to data before geom gets it

▶ example: histograms work on binned data
How do we make this plot?

How do we make this plot?

Two Questions:

How do we make this plot?

Two Questions:

1. What do we want R to do? (What is the goal?)
2. What does R need to know?

How do we make this plot?

Two Questions:

1. Goal: scatterplot = a plot with points

2. What does R need to know?

   ▸ data source: `Births78`
   ▸ aesthetics:

      ▸ `date -> x`
      ▸ `births -> y`
      ▸ default color (same for all points)

How do we make this plot?

1. Goal: scatterplot = a plot with points

   ▸ ggplot() + geom_point()

2. What does R need to know?

   ▸ data source: data = Births78
   ▸ aesthetics: aes(x = date, y = births)

How do we make this plot?

1. Goal: scatterplot = a plot with points

   ▸ ggplot() + geom_point()

2. What does R need to know?

   ▸ data source: data = Births78
   ▸ aesthetics: aes(x = date, y = births)

```
ggplot(data = Births78, aes(x = date, y = births)) +
  geom_point()
```

How do we make this plot?

1. Goal: scatterplot = a plot with points
   - ggplot() + geom_point()

2. What does R need to know?

   - data source: data = Births78
   - aesthetics: aes(x = date, y = births)

```
ggplot(data = Births78, aes(x = date, y = births)) +
  geom_point()
```
```
ggplot() +
  geom_point(data = Births78, aes(x = date, y = births))
```

How do we make this plot?

What has changed?
How do we make this plot?

What has changed?

  ▶ new aesthetic: mapping color to day of week
Mapping color to day of week

```
ggplot(data = Births78) +
  geom_point(aes(x = date, y = births, color = wday))
```
How do we make this plot?
How do we make this plot?

This time we use lines instead of dots

```
ggplot(data = Births78) +
  geom_line(aes(x = date, y = births, color = wday))
```

How do we make this plot?

How do we make this plot?

This time we have two **layers**, one with points and one with lines

```
ggplot(data = Births78,
       aes(x = date, y = births, color = wday)) +
  geom_point() +  geom_line()
```
How do we make this plot?

This time we have two **layers**, one with points and one with lines
```
ggplot(data = Births78,
       aes(x = date, y = births, color = wday)) +
  geom_point() +  geom_line()
```

- ▶ The layers are placed one on top of the other: the points are *below* and the lines are *above*.
- ▶ `data` and `aes` specified in `ggplot()` affect all geoms

Alternative Syntax

```
Births78 %>%
  ggplot(aes(x = date, y = births, color = wday)) +
  geom_point() +
  geom_line()
```
What does this do?

```
Births78 %>%
  ggplot(aes(x = date, y = births, color = "navy")) +
  geom_point()
```

What does this do?

```
Births78 %>%
  ggplot(aes(x = date, y = births, color = "navy")) +
  geom_point()
```

This is *mapping* the color aesthetic to a new variable with only one value ("navy").
So all the dots get set to the same color, but it's not navy.

Setting vs. Mapping

If we want to *set* the color to be navy for all of the dots, we do it this way:

```
Births78 %>%
  ggplot(aes(x = date, y = births)) +    # map these
  geom_point(color = "navy")            # set this
```

▶ Note that color = "navy" is now outside of the aesthetics list. That's how ggplot2 distinguishes between mapping and setting.

How do we make this plot?

How do we make this plot?

```
Births78 %>%
  ggplot(aes(x = date, y = births)) +
  geom_line(aes(color = wday)) +        # map color here
  geom_point(color = "navy")            # set color here
```

- ▶ ggplot() establishes the default data and aesthetics for the geoms, but each geom may change these defaults.
- ▶ good practice: put into ggplot() the things that affect all (or most) of the layers; rest in geom_blah()

Other geoms

```r
apropos("^geom_") %>% head(21)
```

```
 [1] "geom_abline"      "geom_area"        "geom_ash"
 [4] "geom_bar"         "geom_bin2d"       "geom_blank"
 [7] "geom_boxplot"     "geom_contour"     "geom_count"
[10] "geom_crossbar"    "geom_curve"       "geom_density"
[13] "geom_density_2d"  "geom_density2d"   "geom_dotplot"
[16] "geom_errorbar"    "geom_errorbarh"   "geom_freqpoly"
[19] "geom_hex"         "geom_histogram"   "geom_hline"
```
help pages will tell you their aesthetics, default stats, etc.

```r
?geom_area                 # for example
```

Let's try geom_area

```
Births78 %>%
  ggplot(aes(x = date, y = births, fill = wday)) +
  geom_area()
```

This is not a good plot

Let's try geom_area

```
Births78 %>%
  ggplot(aes(x = date, y = births, fill = wday)) +
  geom_area()
```

This is not a good plot

- ▶ overplotting is hiding much of the data
- ▶ extending y-axis to 0 may or may not be desirable.

Side note: what makes a plot good?

Most (all?) graphics are intended to help us make comparisons

- How does something change over time?
- Do my treatments matter? How much?
- Do men and women respond the same way?

Key plot metric: Does my plot make the comparisions I am interested in

- easily, and
- accurately?
Time for some different data

HELPrct: Health Evaluation and Linkage to Primary care
randomized clinical trial

```
?HELPrct
```

Subjects admitted for treatment for addiction to one of three
substances.

Why are these people in the study?

```
HELPrct %>%
  ggplot(aes(x = substance)) +
  geom_bar()
```

# Why are these people in the study?

```
HELPrct %>%
  ggplot(aes(x = substance)) +
  geom_bar()
```

- Hmm. What's up with y?

Why are these people in the study?

```
HELPrct %>%
  ggplot(aes(x = substance)) +
  geom_bar()
```

- ▶ Hmm. What's up with y?
    - ▶ stat_bin() is being applied to the data before the
      geom_bar() gets to do its thing. Binning creates the y values.

Data Flow

org data $\xrightarrow{\text{stat}}$ statified $\xrightarrow{\text{aesthetics}}$ aesthetic data $\xrightarrow{\text{scales}}$ scaled data

Simplifications:

- Aesthetics get computed twice, once before the stat and again after. Examples: bar charts, histograms
- We need to look at the aesthetics to figure out which variable to bin
  - then the stat does the binning
  - bin counts become part of the aesthetics for geom: `y = ..count..`
- This process happens *in each layer*
- `stat_identity()` is the "do nothing" stat.

How old are people in the HELP study?

How old are people in the HELP study?

```
HELPrct %>%
  ggplot(aes(x = age)) +
  geom_histogram()
```

```
## `stat_bin()` using `bins = 30`. Pick better value with
## `binwidth`.
```

Notice the messages

- stat_bin: Histograms are not mapping the raw data but binned data.
  stat_bin() performs the data transformation.
- binwidth: a default binwidth has been selected, but we should really choose our own.
Setting the binwidth manually

```
HELPrct %>%
  ggplot(aes(x = age)) +
  geom_histogram(binwidth = 2)
```

How old are people in the HELP study? – Other geoms

```
HELPrct %>%
  ggplot(aes(x = age)) +
  geom_ash(binwidth = 2, colour = "navy", size = 1.2) +
  geom_density(colour = "forestgreen", size = 1.2) +
  geom_freqpoly(binwidth = 2, aes(y = ..density..))
```
Selecting stat and geom manually

Every geom comes with a default stat

- ▶ for simple cases, the stat is stat_identity() which does nothing
- ▶ we can mix and match geoms and stats however we like

```
HELPrct %>%
  ggplot(aes(x = age)) +
  geom_line(stat = "density")
```
Selecting stat and geom manually

Every stat comes with a default geom, every geom with a default stat

- ▶ we can specify stat instead of geom, if we prefer
- ▶ we can mix and match geoms and stats however we like

```
HELPrct %>%
  ggplot(aes(x = age)) +
  stat_density(geom = "line")
```
More combinations

```
HELPrct %>%
  ggplot(aes(x = age)) +
  geom_point(stat = "bin", binwidth = 3) +
  geom_line(stat = "bin", binwidth = 3)
```

```
HELPrct %>%
  ggplot(aes(x = age)) +
  geom_area(stat = "bin", binwidth = 3)
```
Your turn: How much do they drink? (i1)

Create a plot that shows the distribution of the average daily
alcohol consumption in the past 30 days (i1).
How much do they drink? (i1)

```
HELPrct %>%
  ggplot(aes(x = i1)) + geom_histogram()
```

```
HELPrct %>%
  ggplot(aes(x = i1)) + geom_area(stat = "density")
```

Covariates: Adding in more variables

Q. How does alcohol consumption (or age, your choice) differ by sex and substance (alcohol, cocaine, heroin)?
Decisions:

- How will we display the variables: `i1` (or age), `sex`, `substance`
- What comparisons are we most interested in?
Give it a try.

- Note: I'm cheating a bit. You may want to do some things I haven't shown you yet. (Feel free to ask.)

Covariates: Adding in more variables

Using color and linetype:

```
HELPrct %>%
  ggplot(aes(x = i1, color = substance, linetype = sex)) +
  geom_line(stat = "density")
```

Using color and facets

```
HELPrct %>%
  ggplot(aes(x = i1, color = substance)) +
  geom_line(stat = "density") + facet_grid( . ~ sex)
```
Boxplots

Boxplots use `stat_quantile()` which computes a five-number summary (roughly the five quartiles of the data) and uses them to define a "box" and "whiskers". The quantitative variable must be `y`, and there must be an additional `x` variable.

```
HELPrct %>%
  ggplot(aes(x = substance, y = age, color = sex)) +
  geom_boxplot()
```
Horizontal boxplots

Horizontal boxplots are obtained by flipping the coordinate system:

```
HELPrct %>%
  ggplot(aes(x = substance, y = age, color = sex)) +
  geom_boxplot() +
  coord_flip()
```

▶ coord_flip() may be used with other plots as well to reverse the roles of x and y on the plot.

Give me some space

We've triggered a new feature: `dodge` (for dodging things left/right). We can control how much if we set the dodge manually.

```
HELPrct %>%
  ggplot(aes(x = substance, y = age, color = sex)) +
  geom_boxplot(position = position_dodge(width = 1))
```
Issues with bigger data

```
require(NHANES); dim(NHANES)
```

```
## [1] 10000    76
```

```
NHANES %>% ggplot(aes(x = Height, y = Weight)) +
  geom_point() + facet_grid(Gender ~ PregnantNow)
```

- ▶ Although we can see a generally positive association (as we would expect), the overplotting may be hiding information.

Using alpha (opacity)

One way to deal with overplotting is to set the opacity low.

```
NHANES %>%
  ggplot(aes(x = Height, y = Weight)) +
  geom_point(alpha = 0.01) +
  facet_grid(Gender ~ PregnantNow)
```
geom_density2d

Alternatively (or simultaneously) we might prefer a different geom altogether.

```
NHANES %>%
  ggplot(aes(x = Height, y = Weight)) +
  geom_density2d() + facet_grid(Gender ~ PregnantNow)
```
geom_hex

```
NHANES %>%
  ggplot(aes(x = Height, y = Weight)) +
  geom_hex() + facet_grid(Gender ~ PregnantNow)
```
Multiple layers

```
ggplot(data = HELPrct, aes(x = sex, y = age)) +
  geom_boxplot(outlier.size = 0) +
  geom_jitter(alpha = .6) +
  coord_flip()
```
Multiple layers

```
ggplot(data = HELPrct, aes(x = sex, y = age)) +
  geom_boxplot(outlier.size = 0) +
  geom_point(position = position_jitter(width = .3, height
  coord_flip()
```

Labeling

```
NHANES %>%
  ggplot(aes(x = Height, y = Weight)) +
  geom_hex() + facet_grid(Gender ~ PregnantNow) +
  labs(x = "waist (m)", y = "weight (kg)",
       title = "weight vs height")
```

Things I haven't mentioned (much)

- ► scales (fine tuning mapping from data to plot)
- ► guides (so reader can map from plot to data)
- ► coords (`coord_flip()` is good to know about)
- ► themes (for customizing appearance)

```
require(ggthemes)
ggplot(data = Births78, aes(x = date, y = births)) +
        geom_point() + theme_wsj() # wall street journal
```
Things I haven't mentioned (much)

- ▶ scales (fine tuning mapping from data to plot)
- ▶ guides (so reader can map from plot to data)
- ▶ coords (`coord_flip()` is good to know about)
- ▶ themes (for customizing appearance)

```
require(xkcd)
ggplot(data = Births78,
       aes(x = date, y = births, colour = wday)) +
       geom_smooth(se = FALSE) + theme_xkcd()
```

Figure 1: births

Things I haven't mentioned (much)

- ► scales (fine tuning mapping from data to plot)
- ► guides (so reader can map from plot to data)
- ► coords (`coord_flip()` is good to know about)
- ► themes (for customizing appearance)
- ► position (`position_dodge()` can be used for side by side bars)

```
ggplot(data = HELPrct,
       aes(x = substance, y = age, color = sex)) +
  geom_violin(position = position_dodge()) +
  geom_point(aes(color = sex, fill = sex),
             position = position_jitterdodge())
```

Things I haven't mentioned (much)

- scales (fine tuning mapping from data to plot)
- guides (so reader can map from plot to data)
- themes (for customizing appearance)
- position (`position_dodge()`, `position_jitterdodge()`, `position_stack()`, etc.)

A little bit of everything

```
ggplot(data = HELPrct,
       aes(x = substance, y = age, color = sex)) +
  geom_boxplot(position = position_dodge(width = 1)) +
  geom_point(aes(fill = sex), alpha = .5,
    position = position_jitterdodge(dodge.width = 1)) +
  facet_wrap(~homeless)
```
A short cut

mplot(dataframe) provides an interactive plotting tool

```
mplot(HELPrct)
```

- ▶ quickly make several plots from a data frame
- ▶ can show the expression so you can learn how to do it or copy and paste into another document
- ▶ ggplot2 or lattice

Want to learn more?

- docs.ggplot2.org/
- Winston Chang's: *R Graphics Cookbook*

What's around the corner?

ggvis

- ▶ dynamic graphics (brushing, sliders, tooltips, etc.)
- ▶ uses Vega (D3) to animate plots in a browser
- ▶ similar structure to `ggplot2` but different syntax and names

Dynamic documents

- ▶ combination of `RMarkdown`, `ggvis`, and `shiny`
